

## For Immediate Release

### **Landis Company Launches New Inventory Management and Reporting System**

*Landis Inventory Management System Integrates the Entire Fulfillment Process;  
Provides Customers with Easy-to-Use Web-Based Reporting Tools*

**READING, PA, March 30, 2009** – Landis Company, a leader in warehousing, fulfillment, and logistics services, announced the rollout of the Landis Inventory Management System, a powerful and flexible web-based system for managing the entire warehousing and fulfillment process – from order processing on the front end, to warehouse and inventory management, through to final shipping.

The Landis Inventory Management System is based on advanced software from Traker Systems, a proven provider of applications for the third party logistics (3PL) marketplace. Based on the Windows operating environment, the Landis Inventory Management is easy-to-use and cost-effective to maintain. Landis' customers can utilize the desktop-based system without investing in additional hardware.

Rob Tompkins, President and CEO of Landis Company, commented, "The launch of the Landis Inventory Management System underscores Landis' commitment to implement advanced technology to maximize the quality and effectiveness of our customers' fulfillment programs."

#### **Features and Benefits of the Landis Inventory Management System:**

##### **Easy-to-Use, Secure Web-Based Interface**

Using the password-protected, front-end web portal, customers can enter orders and retrieve inventory information 24 hours a day, 7 days a week. All program-related transactions – incoming orders, outbound shipments, inventory levels, and invoices – are viewable in real time.

##### **Comprehensive Order and Inventory Management**

The Landis Inventory Management System provides powerful capabilities for managing orders and controlling inventory efficiently and accurately. The system seamlessly accepts orders from a wide range of popular formats. Once an order is entered, the system automatically allocates proper quantities and removes them from inventory. Customers can manage their product inventory at various levels of detail and are automatically notified when stock is low.

##### **Real Time Reporting Tools**

In addition to 24x7 web access, the Landis Inventory Management System provides a rich set of reports for real time decision-making and analysis of product turnover, revenue from invoicing, warehouse movement, and much more.

“In today’s challenging economic times, customers are looking for solutions that will help them gain a competitive edge and lower their costs. The Landis Inventory Management does just that – facilitating faster, more accurate fulfillment and providing powerful decision-making tools, added Tompkins.”
